

LC 600 LeakCam - The new generation of the leak detectors

CS INSTRUMENTS has been a leading global manufacturer of measurement technology for compressed air and gases for more than 20 years. The expertise and knowledge gained from the development of leak detectors have been incorporated into the development and research of the LeakCam 600.

and leakage measurement of compressed air and gases. This know-how, coupled with over 20 years of experience in the development of leak detectors, has gone into the development of the LeakCam 600.

During development, particular attention was paid to practicality and user-friendliness. What does it really mean for the service technician or maintenance engineer to search for and document gas leaks and compressed air leaks in the production process with a leakage camera in their hand for 8 hours, for example?

Unlike many other leakage cameras, the LC 600 was developed with these points in mind, such as:

- The unique integrated laser distance measurement automatically calculates the distance to the leak. There is no need for time-consuming and incorrect distance measurement as with other devices. Precise measurement of the distance to the leak is the most important parameter for accurate leakage calculation.
- Special camera module for wide-angle view, allowing the user to quickly gain an overview of larger rooms
- LED for illuminating dark rooms
- Carrying strap, included
- Battery replacement concept

Features

1280 x 720 Pixel for precise leak localization

Cost Quantification
allocation and savings
Shows the leakage rate in l/min and costs in €

Neck Strap Loops
Comfortable and easy handling

Grip for One-Handed Operation
Leaving the other hand for the touchscreen

18 V Einhell Power X-Change
Two batteries with an external charger for up to 8 hours of use

64 MEMS Microphones (2 kHz - 80)
Detects minor leaks from up to 10 meters

High-resolution images for clear leak documentation

Laser Distance Module
Precise ultrasound focusing and leak rate estimation

5 LEDs & Ambient Light Sensor
Enhance image quality in dark environments

POWER BEAM FORMING

“Power Beam Forming” sets new standards in leak detection

Cost and CO2 savings - but also safety aspects - are the driving forces behind leak detection in gas, compressed air or vacuum applications. With the LC 600 in combination with an ultrasonic transmitter, leak tests can also be carried out reliably. The LeakCam 600 only requires 64 microphones for these tasks and achieves unique dynamics and sensitivity. This means that even very small leaks can be made visible in the presence of large, dominant ultrasonic sources. Dominant sources can be larger leaks, but also disturbing noises - caused by production machines.

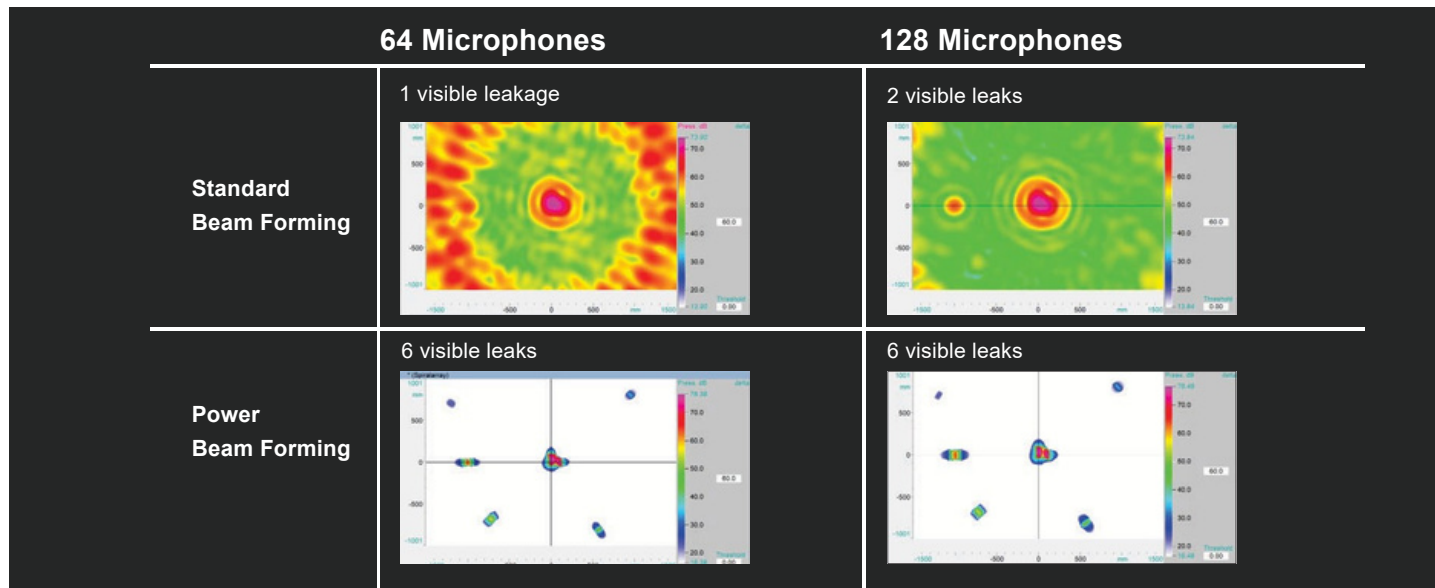

Advantages of Power Beam Forming at a glance:

Reliability due to unique dynamics - small leaks are no longer overlooked in the presence of large leaks.

Even faster work: One look with the LeakCam 600 covers an approx. 50% larger area more reliably than competitor products.

Ultrasonic cameras with up to 200 microphones that are currently available advertise a huge time saving in leak detection compared to conventional devices. However, all these devices fail to detect various leaks due to a decisive technological disadvantage - especially when there are several leaks in a small space or individual, major leaks.

Using the standard beam forming method, even doubling the number of microphones to 128 can only detect a second leak. Additional microphones do not provide any added value.

Thanks to the Power Beam Forming process and the associated dynamics, the LC 600 can fully exploit the advantage of the large image aperture angle. The device can check an area of 4 x 3m from a distance of 3m at a glance - without missing any small leaks.

How does an acoustic/ultrasonic camera for leak detection work?

Acoustic and ultrasonic cameras have several microphones whose signals are bundled by beamforming algorithms to make sound their arrangement.

For leak detection of pressurized gases, the ultrasonic range around 40 kHz is typically used, as this is where the characteristic noises production environments.

Threefold better leak detection through Power Beam Forming

(Standard Beam Forming)

There are various beamforming methods, with standard beamforming being used in the ultrasonic cameras currently available, as it is relatively simple and does not require much computing power. However, the dynamic range is limited to around 4 dB, which means that only the loudest leakage is detected, while quieter noises are overlooked.

The dynamic range therefore describes how much the volume of

the sound

LeakCam 600 with 64 microphones
(Power Beam Forming)

The LeakCam uses

the **Power Beam Forming**, which achieves a unique . With Power Beam Forming, multiple sound sources

Thanks to the higher dynamic range, quieter ultrasonic noises can be detected in leaks in automated systems or the compressor room. Power Beam Forming can therefore be used to search areas from a greater distance without overlooking "weaker" leaks!

Precision

Wide Microphone Spacing for Precise Leak Detection from Near to Far

The 20 cm microphone spacing of the LeakCam – measured as the diameter between the outermost microphones – ensures maximum precision in leak detection. In close range, it allows for pinpoint localization of even the smallest leaks, while in long-range applications, it provides reliable detection over greater distances. For enhanced focusing, the integrated laser distance module can be used. This ensures the LeakCam delivers clear and precise results – regardless of the distance to the leak.

Precise leak detection from far distances with acoustic zoom

With the “acoustic zoom” of the LeakCam 600, leaks can be precisely localized from far distances by focusing ultrasonic noises even more strongly. In combination with the optical zoom (x2, x4, x8), this gives you

access

Highest precision even at close range - LeakCam 600 for distances from 10 cm

The LeakCam enables extremely precise leak detection at close ranges from 10cm and above due to the maximum transit time the leak, smaller leaks can be found. This ensures a particularly precise coloration of the ultrasonic image, so that you can clearly distinguish between a leaking thread and a damaged coupling in the case of a quick coupling. This allows the cause of the leak to be determined quickly and precisely, even with the smallest defects.

Application

Application Pneumatics

found in the smallest of spaces. Thanks to Power Beam Forming, you can see all leaks at a glance. Small leaks are no longer overlooked in the presence of large leaks. The device therefore

Application technical Gases

In addition to compressed air, the LC 600 is used for a wide range of technical gases such as nitrogen, argon, carbon dioxide, helium or hydrogen. Leaks can be detected with pinpoint accuracy even from great distances. This is ensured by a very high sensitivity and the optical zoom, among other things.

Application Flammable Gases

The device works from the lowest system pressures of around 250 mbar and detects leaks even from a greater distance than conventional can be covered.

Application Refrigerant Systems

Ammonia and CO2 refrigerant systems where only the smallest leaks are tolerated can be tested with the LC600. Thanks to its unique

Application Discharge / Corona Effect

The LC 600 can detect partial discharges even in noisy environments and from a distance of up to 120 meters. Large area scanning and non-contact measurement save time compared to other methods.

Application Vacuum

Unlike compressed air leaks, where the sound generated by the leak is emitted into the environment, the sound generated by

here too thanks to its unparalleled sensitivity.

Application Leak Test

In combination with an ultrasonic transmitter, the LC 600 can be used to carry out leak tests. Acceptance of pressure vessels, commissioning of extinguishing systems, leak tests of driver's cabs or blow door tests can be made much easier and faster.

Save Leak

The location of each leak can be stored: Company / building / location

Efficiency and clarity also for elimination of leaks. Definition of the necessary spare parts and maintenance work already on site.

Spare parts list in the device

The software can be used to transfer a custom spare parts list to the device. The device offers an intelligent search function with auto-complete feature. The list with the required spare parts can be exported from the CS Leak Reporter software.

Reporting Software

CS Leak Reporter - cloud solution

Ideal for leak detection service providers and for companies/ major corporations with multiple locations.

- Each “user” in the leakage search team can be assigned a role (e.g. leakage search, leakage repair, monitoring, checking for success)
- Access rights to individual or all projects can be assigned individually to each user
- The browser-based software ensures a common database in real time and paperless documentation

CS Leak Reporter - PC solution

Creates detailed ISO50001 reports. Provides an illustrated overview of the leaks found and their savings potential. Measures for elimination, including status computers
